INTERFACE OVERVIEW

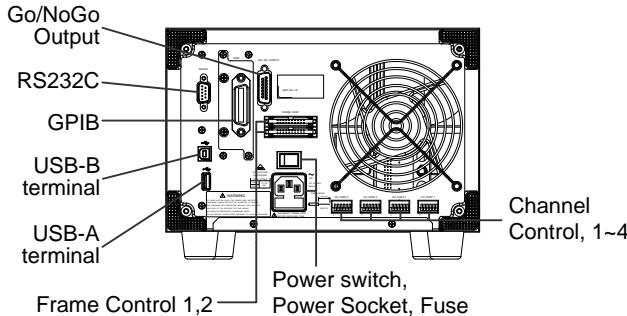

This manual describes how to use the PEL-2000A's remote command functionality and lists the command details. The Overview chapter describes how to configure the PEL-2000A USB/RS232/GPIB remote control interface.

Rear Panel Overview

PEL-2004A

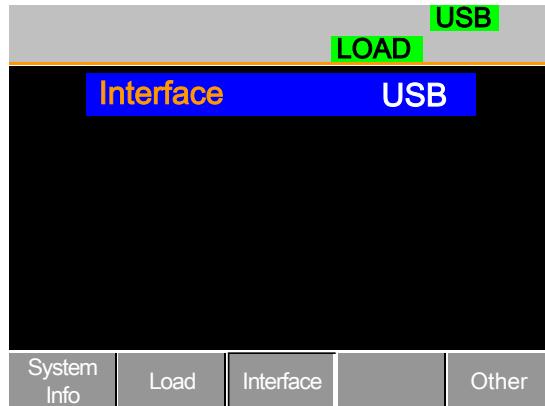

PEL-2002A

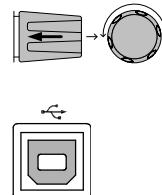

Configuring the USB Interface

USB connection	PC side connector	Type A, host
PEL-2000A side	connector	Type B, device
Speed	1.1/2.0 (full speed)	

- Panel operation
1. Press the Shift Key then the Help key to access the Utility menu.
 2. Press F3(Interface Menu).

3. If the interface is not USB, use the selector knob to choose USB.
4. Connect the USB cable to the USB-B slave port on the rear.

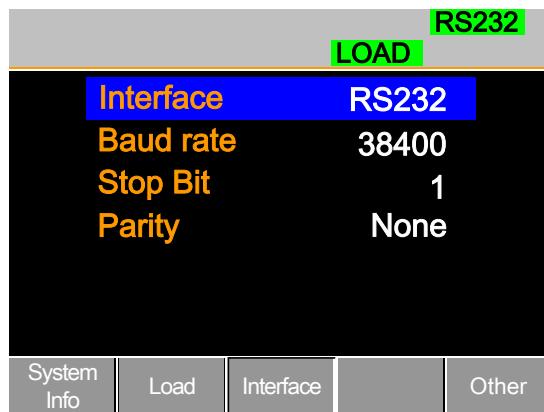

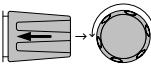

5. When the PC asks for the USB driver, select pel_cdc_2000.inf (downloadable from the GW website, www.gwinstek.com, PEL-2000A product corner).
6. On the PC, activate a terminal application such as MTTTY (Multi-Threaded TTY). To check the COM port No., see the Device Manager in the PC. For WindowsXP, select Control panel → System → Hardware tab.
7. Run this query command via the terminal application.
*idn?
This command should return the manufacturer, model number, serial number, and firmware version in the following format.
GW, PEL-2002/2004, 00000001, V1.00
8. Configuring the command interface is completed. Refer to the other chapters for more details.

RS-232C Interface Configuration

	Baud rate	2400, 4800, 9600, 19200, 38400
	Parity	None, Odd, Even
	Data bit	8 (fixed)
	Stop bit	1, 2

- Panel operation
1. Press the Shift Key then the Help key to access the Utility menu.

 2. Press the Shift Key then the Help key to access the Utility menu.

3. If the interface is not set to RS232,  use the selector knob to change the interface to RS232.

4. Edit the Baud rate, Stop bit and parity.

Baud rate 2400, 4800, 9600, 19200, 38400

Stop Bit Range 1,2

Parity Range None, Odd, Even

5. Connect the RS-232C cable to the rear panel port: DB-9 male connector.

RS232C

Terminal application

Invoke a terminal application such as MTTTY (Multi-Threaded TTY).

- For RS-232C, set the COM port, baud rate, stop bit, data bit, and parity accordingly.

To check the COM port No. for RS-232C, see the Device Manager in the PC. For WinXP, Control panel → System → Hardware tab.

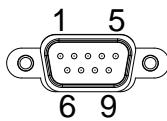

6. Ensure the terminal application has the following settings;
7. Baud rate – as per PEL-2000A settings
8. Com Port – as per PC settings (Device Manager)
9. Parity – None
10. Data bits – 8
11. Stop bits – None

Functionality check Run this query command via the terminal.
`*idn?`

This should return the Manufacturer, Model number, Serial number, and Firmware version in the following format.

GW, PEL-2002/2004, 00000001, V1.00

Pin assignment

2: RxD (Receive data)

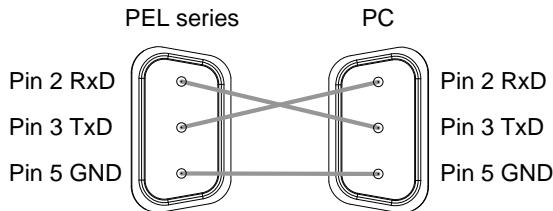

3: TxD (Transmit data)

5: GND

1, 4, 6, 7,8, 9: No connection

PC connection

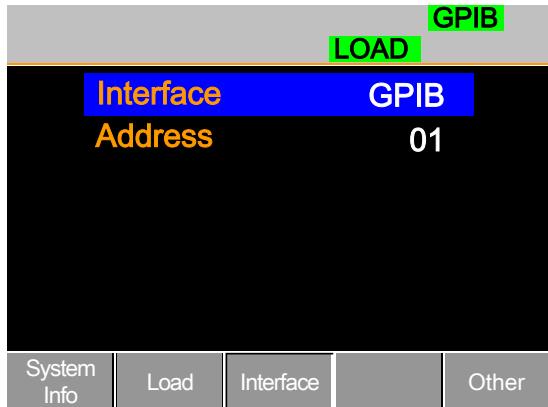

Use the Null Modem connection as shown in the diagram below.

GPIB Interface Configuration

Panel operation

1. Press the Shift Key then the Help key to access the Utility menu.
2. Press F3(Interface Menu).

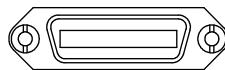

3. If the interface is not set to GPIB, use the selector knob to change the interface to GPIB.

4. Edit the GPIB address.

5. Connect the GPIB cable to the rear panel port: 24-pin female connector

GPIB constraints

- Maximum 15 devices altogether, 20m cable length, 2m between each device
- Unique address assigned to each device
- At least 2/3 of the devices turned On
- No loop or parallel connection

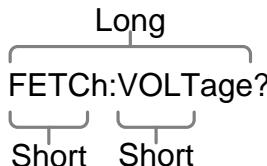

COMMAND OVERVIEW

The Command overview chapter lists all the PEL-2000A commands and command queries .The command syntax section shows you the basic rules you have to apply when using commands.

Command Syntax

Compatible standard	<ul style="list-style-type: none">• IEEE488.2, 1992 (fully compatible)• SCPI, 1994 (partially compatible)
Command types	There are a number of different instrument commands and queries. A command sends instructions or data to the electronic load and a query receives data or status information from the electronic load.
Command Types	
Simple	A single command with/without a parameter
Example	*OPC
Compound	Two or more commands separated by a colon (:) with/without a parameter
Example	UTILITY:SOUND 1
Query	A query is a simple or compound command followed by a question mark (?). A parameter (data) is returned.
Example	UTILITY:SOUND?

Command forms Commands and queries have two different forms, long and short. The command syntax is written with the short form of the command in capitals and the remainder (long form) in lower case.

The commands can be written in capitals or lower-case, just so long as the short or long forms are complete. An incomplete command will not be recognized.

Below are examples of correctly written commands.

LONG FETCh:VOLTage? FETCH:VOTAGE?

 fetch:voltage?

SHORT FETC:VOLT? fetc:volt?

Square Brackets Commands that contain square brackets indicate that the contents are optional. The function of the command is the same with or without the square bracketed items, as shown below.

Example:

:LOAD[:STATe]

= :LOAD:STATe

= :LOAD

Command format :PROGram:CHAin <NR1>LF 1: command header

 2: single space

 3: parameter

 4: message terminator

Parameter	Type	Description	Example
	<Boolean>	Boolean logic	0, 1
	<NR1>	integers	0, 1, 2, 3
	<NR2>	decimal numbers	0.1, 3.14, 8.5
	<NR3>	floating point	4.5e-1, 8.25e+1
	<NRf>	any of NR1, 2, 3	1, 1.5, 4.5e-1
	<NRf+>	NRf type including MIN (minimum) and MAX (maximum) limits of the parameter.	1, 1.5, 4.5e-1 MAX, MIN
	<aard>	Arbitrary ascii characters.	
	<block data>	IEEE-488.2 binary block data. The block data is comprised of five parts:	
		#216<16_bytes_data><NL>	
		ab c d e	
		a. Initialization character (#) b. Digit length (in ASCII) of the number of bytes c. Number of bytes d. Binary data e. New line character	
Message terminator	LF^END	line feed code (hexadecimal 0A) with END message	
	LF	line feed code	
	<dab>^END	last data byte with END message

S TATUS REGISTERS

To program the PEL-2000A Series effectively, the Status Register structure needs to be understood. This chapter explains in detail the structure of the status registers.

Status Register Overview

Description	<p>The status registers are used to determine the status of the electronic load. The status registers maintain the status of the protection conditions, load conditions and channel conditions of the load modules.</p> <p>The PEL-2000A series have a number of register groups:</p> <ul style="list-style-type: none">Channel Status Registers (one for each channel)Channel Summary RegistersQuestionable Status RegistersStandard Event Status RegistersStatus Byte RegisterService Request Generation Register

The structure of the status registers is shown on the next page.

Channel Status

Description	Each channel has a dedicated Channel Status Register group. These registers show if any errors or faults have occurred to a specific channel.
	The Channel Status Register group consists of: the Condition, EVENT and ENABLE registers as well as PTR/NTR (positive and negative transition) filters.

Channel Status Registers

Bit Position	7-15	6	5	4	3	2	1	0
Condition	0	UVP	G/N	OT	RV	OP	OV	OC
PTR/NTR	0	UVP	G/N	OT	RV	OP	OV	OC
EVENT	0	UVP	G/N	OT	RV	OP	OV	OC
ENABLE	0	UVP	G/N	OT	RV	OP	OV	OC
Bit weight		64	32	16	8	4	2	1

Protection Bits	OC	If an over current condition occurs the OC bit (bit 0) is set. The OC bit can only be cleared with the :LOAD:PROTection:CLEar command.
	OV	If an over voltage condition occurs the OV bit (bit 1) is set. The OV bit can only be cleared with the :LOAD:PROTection:CLEar command.
	OP	If an over power condition occurs the OP bit (bit 2) is set. The OP bit can only be cleared with the :LOAD:PROTection:CLEar command.
	RV	If a reverse voltage condition occurs the RV bit (bit 3) is set. The RV bit is automatically cleared after the reverse voltage is removed.
	OT	When the internal temperature exceeds 85°C the OT bit will be set. The OT bit is automatically cleared after the temperature goes below 85°C.

G/N	The Go/NoGo bit is set when Go/NoGo limits have been exceeded, when Go/NoGo SPEC has been enabled.
UVP	If the under voltage condition occurs the UVP bit is set.
Condition Register	The condition register indicates the status of the electronic load. The condition register can only be changed by a change in the condition of the electronic load. Reading the condition register does not change the state of the condition register.
PTR/NTR Register	The PTR/NTR (Positive/Negative transition) register determines the type of transition conditions that will trigger an event. Only the Channel Status Register and Questionable Status Register can be transition programmed
	Positive Transition 0→1
	Negative Transition 1→0
Event Register	The Event Register indicates if an event has been triggered according to the transition settings from the PTR/NTR Register.
Enable Register	The Enable register determines which status event(s) are enabled. Any status events (OC, OV, OP, RV, OT, G/N, UVP) that are enabled will set the corresponding channel bit in the Channel Summary Event Register.

Channel Summary

Description	The Channel Summary Registers consolidate the channel status of all 4/8 channels, depending on the electronic load.
-------------	---------------------------------------------------------------------------------------------------------------------

Channel Summary Registers

Bit Position	7	6	5	4	3	2	1	0
Event	CH8	CH7	CH6	CH5	CH4	CH3	CH2	CH1
Enable	CH8	CH7	CH6	CH5	CH4	CH3	CH2	CH1
Bit weight	128	64	32	16	8	4	2	1

Event Register	If an event has been enabled and set in the Channel Status Registers, then the corresponding channel bit will be set in the Channel Summary Event Register. If the Event Register is read, it will be cleared to 0.
Enable Register	The Enable Register is used to determine which channel events will be used to set the CSUM bit of the Status Byte Register.

Questionable Status

Description	The Questionable Status Registers will show if any faults or errors have occurred. The Questionable Status Registers have the same events as the Channel Status Registers.
-------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Questionable Status Register

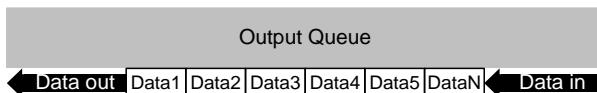

Bit Position	7-15	6	5	4	3	2	1	0
Condition	0	UVP	G/N	OT	RV	OP	OV	OC
PTR/NTR	0	UVP	G/N	OT	RV	OP	OV	OC
EVENT	0	UVP	G/N	OT	RV	OP	OV	OC
ENABLE	0	UVP	G/N	OT	RV	OP	OV	OC
Bit weight		64	32	16	8	4	2	1

Bit Summary	OC	Over Current
	OV	Over voltage
	OP	Over Power
	RV	Reverse Voltage
	OT	Over Temperature
	G/N	Go/NoGo

UVP Under Voltage Protection	
Condition Register	The Questionable Status Condition Register indicates the status of the electronic load. If a bit is set in the Condition register (OC, OV, OP, RV) indicates that the event is true. Reading the condition register does not change the state of the condition register.
PTR/NTR Register	The PTR/NTR (Positive/Negative transition) register determines the type of transition conditions will set the corresponding bit in the Event Registers. Only the Channel Status Register and Questionable Status Register can be transition programmed.
	Positive Transition 0→1
	Negative Transition 1→0
Event Register	The PTR/NTR Register will dictate the type of transition conditions will set the corresponding bits in the Event Register. If the Event Register is read, it will be cleared to 0.
Enable Register	The Enable Register is used to determine which channel events will be used to set the QUES bit of the Status Byte Register.

Output Queue

Description	The Output queue stores output messages in a FIFO buffer until read. If the Output Queue has data, the MAV bit in the Status Byte Register is set.
-------------	----------------------------------------------------------------------------------------------------------------------------------------------------

Standard Event Status

Description The Standard Event Status Registers indicate any programming errors that occur. The Standard Event Status Register group comprises of the Event and Enable registers.

Standard Event Status Registers								
Bit Position	7	6	5	4	3	2	1	0
EVENT	0	0	CME	EXE	DDE	QYE	OPC	0
ENABLE	0	0	CME	EXE	DDE	QYE	OPC	0
Bit weight	128	64	32	16	8	4	2	1

Error Bits	OPC	The operation complete bit is set when all selected pending operations are complete. This bit is set in response to the *OPC command.
	QYE	The Query Error bit is set in response to an error reading the Output Queue. This can be caused by trying to read the Output Queue when there is no data present.
	DDE	The Device Dependent Error indicates a memory error/lost memory or failure of the self-test.
	EXE	The Execution bit indicates an execution error due to one of the following Illegal command parameter Parameter out of range Invalid parameter Command didn't execute due to an overriding operation condition.

CME	The Command Error bit is set when a syntax error has occurred. The CME bit can also be set when a <GET> command is received within a program message. (Group Execute Trigger) as defined in IEEE 488.1.
Event Register	The Event Register will be set to 0 when read.
Enable Register	The Enable Register determines which events will set the ESB Bit (bit 5) in the Status Byte Register.

Status Byte Register

Description	The Status Byte register consolidates the status events of all the status registers. The Status Byte register can be read with the *STB? query or a serial poll and can be cleared with the *CLS command.								
Status Byte Register									
Bit Position	7	6	5	4	3	2	1	0	
Condition	0	MSS	ESB	MAV	QUES	CSUM	0	0	

Status Bits	CSUM	The CSUM bit is set when an Enabled event has occurred on a channel. The Channel Condition, Channel Event and Channel Summary Event Registers all determine if the CSUM bit is set.
	QUES	The Questionable bit is set when a questionable event has occurred.
	MAV	The Message Available bit is set when there is outstanding data in the Output Queue.
	ESB	The Event Status bit is set if an enabled event in the Standard Event Status Event Register has occurred.

MSS & RQS The Master Summary Status is used with the *STB? query. When the *STB? query is read the MSS bit is not cleared. The Request Service bit is cleared when it is polled during a serial poll.

Service Request Register

Description The Service Request Generation Register determines which events in the Status Byte Register will generate Service Requests. It is essentially the Status Byte Enable Register. The bit events are the same as the Status Byte Register, minus the MSS/RQS bit.
